## **Health Literacy – Improving Member/Patient Engagement**

Only 12% of all patients are health literate enough to fully obtain, communicate, process and understand basic health information to make informed decisions about their healthcare.

**Health Literacy is independent of formal education.** 

## **What is Health Literacy?**

- 1. The medical team speaking in plain language to members and their support system
- 2. Not using medical jargon
- 3. Repeating the message until the member can repeat it back to you in a way meaningful to the member/patient (Teach Back)
- 4. Using Brown Bag medication reconciliation having members bring all of their medications to you in a brown bag reconciling one medication at a time
- 5. Use the word "medicine" instead of "medication"

## **Why is Health Literacy Important?**

- 1. Improves member/patient engagement
- 2. Improves plan of care compliance
- 3. Improves quality of care
- 4. Decreases rework and increases efficiency
- 5. Improves quality (HEDIS®) scores
- 6. Improves member/patient satisfaction scores (CAHPS®)

Three Focus Points		
What is my problem?	What do I need to do?	Why is it important for me to do this?
